

Proposed Solution

Project Name: ComicCraft – AI Comic Story Creator using Gemini Models

Academic Year: 2026

Project proposal aligned to the ComicCraft implementation.

Project Overview

Objective: Create a simple Generative AI application that transforms a user's story idea into a structured five-panel comic story using Google Gemini models.

Scope: Textual comic story generation with scene descriptions, character actions, dialogue and image prompts, plus downloadable story output. Automatic final comic artwork, user accounts and database persistence are outside the current scope.

Problem Statement

Aspiring creators often have story ideas but need a simple way to convert those ideas into a panel-by-panel comic structure. Existing general-purpose text generation can require manual restructuring and may not preserve character details across scenes.

Proposed Approach

ComicCraft uses Streamlit for the interface and the Google GenAI SDK to send a structured prompt to Gemini. The prompt requires exactly five panels and explicitly requests consistent character identity, appearance, clothing and personality.

Key Features

1. Five-panel AI story generation
2. Scene and action descriptions
3. Character dialogue
4. Detailed image prompts
5. Character consistency instructions
6. Downloadable story output
7. Environment-based API key configuration
